

SCHEMA

It's like having a file cabinet in your head.

It's all of the information you have stored in your brain.

When you are reading, your schema helps you make sense of the text. When you read information, your brain pulls from your pretend file cabinet other information you have learned. It connects the old information with the new. When you experience new things or learn new information, you build new schema.

Schema can be something you learned from a friend, something your parents told you, information you learned from watching TV, or from reading books. It can come from lots of different places. A good reader will try to pull from their schema before reading, while reading, and even after reading. Your schema helps with comprehension, and comprehension is understanding.

When you understand what you read, you **LEARN.**

SCHEMA

It's like having a file cabinet in your head.

It's all of the information you have stored in your brain.

When you are reading, your **schema** helps you *make sense* of the text. When you read information, your brain pulls from your pretend file cabinet *other information* you have learned. It *connects* the old information with the *new*. When you experience new things or learn new information, you *build* new schema.

Schema can be something you learned from a friend, something your parents told you, information you learned from watching TV, or from reading books. It can come from lots of different places. A good reader will try to pull from their schema before reading, while reading, and even after reading. Your schema helps with

comprehension, and comprehension is *understanding*.

When you understand what you read, you **LEARN**.
